UI/UX Design Interview Task

Blog Automation SaaS Platform Design Challenge

Inspiration reference: rank.ai | Additional references: Jasper, Content at Scale

Duration: 3–4 days | Format: Figma

1. Overview

We are building a SaaS platform that lets users automate their blog content — set up an automation once, and the system researches, writes, and publishes SEO-optimized blog posts on a schedule, with minimal manual effort. Users should also be able to review, edit, and manage everything that's been generated from one central dashboard.

rank.ai is the closest reference for the category — an AI content/SEO automation platform combining a marketing site, pricing, and a product dashboard for managing automated content. Use it to understand the space, but this is not a clone task: your job is to design a clean, opinionated product for our specific use case — automated blog generation and publishing — not to replicate rank.ai's full feature set (rank tracking, GBP, local SEO, etc. are out of scope).

Additional references — for the automation setup and content review flows

- Jasper — look at how it structures AI content generation flows, brand voice/tone settings, and campaign/template selection.
- Content at Scale — look specifically at how it presents auto-generated blog posts for review before publishing, and how it communicates SEO scoring/optimization alongside generated content.
- Use these for functional grounding on AI content-generation UX patterns only — your own visual design should stay consistent with the rest of this product, not copy either tool's style.

2. Product Concept — What We're Building

Core idea: a user connects their blog (WordPress, Webflow, Shopify, or a generic CMS/API), sets up one or more 'blog automations' (topic, keywords, tone, frequency, publishing destination), and the platform generates and either auto-publishes or queues posts for review — on repeat, without the user writing anything manually.

Core capabilities to design for

- Pre-built / pre-existing automation templates the user can pick and activate quickly (e.g. 'Weekly SEO Blog', 'Product Update Roundup') rather than configuring everything from scratch
- A way to create a custom automation from scratch (topic/niche, keywords, frequency, tone of voice, destination)
- A central dashboard listing every blog post generated — status (draft, scheduled, published, failed), source automation, word count, publish date
- A review/edit step before publishing (for automations set to 'review before publish')
- Basic performance signals per post (views, or at minimum, publish status and last updated)

3. Scope of Work — Pages to Design

Design the following 5 screens. Design Desktop (1440px) as primary for all 5; additionally design Mobile (375px) for the Marketing Landing Page and the Dashboard (2 of the 5).

3.1 Marketing Landing Page

- Hero communicating the core promise: automated, SEO-optimized blog content on autopilot
- 'How it works' section (e.g. Connect blog → Choose or build an automation → Auto-generate & publish)
- Feature highlights: pre-built automation templates, custom automation builder, multi-CMS publishing, review-before-publish option
- Social proof: testimonials, logos, or usage stats (e.g. articles generated, active automations)
- Pricing teaser section linking to a full pricing page (you do not need to design the full pricing page unless you want to — teaser only)
- Primary CTA: start free / get started, visible in header and at least twice on page
- Footer with product, resources, and company links

3.2 Dashboard — All Blogs Overview

- A table or card view listing every generated/queued blog post across all automations
- Status indicators: Draft, Scheduled, Published, Failed/Needs attention
- Filters: by automation, by status, by destination (blog/CMS), by date range
- Key columns/fields per post: title, source automation, status, scheduled/published date, word count
- Bulk actions (e.g. approve & publish selected, delete selected)
- Empty state for a brand-new account with zero posts yet, guiding the user to activate their first automation
- A persistent way to jump into creating a new automation from this view

3.3 Automation Setup Flow — Choose or Create

- A gallery/list of pre-existing automation templates the user can activate with one click (show at least 4-5 template cards with a short description each, e.g. topic focus and posting frequency)
- A 'Build your own' path into a custom automation configuration flow
- Configuration fields: topic/niche or keyword list, tone of voice, posting frequency (daily/weekly/monthly), publishing destination (WordPress/Webflow/Shopify/manual export), and whether posts should auto-publish or wait for review
- A clear confirmation/summary step before the automation goes live
- Design this as a short guided flow (multi-step or single scrollable form — your choice, justify it)

3.4 Blog Post Review & Editor

- Full view of a single AI-generated blog post: title, meta description, body content, featured image, SEO keyword target
- Inline or side-panel editing of the content before publishing
- Approve & Publish / Reject & Regenerate / Save as Draft actions
- Metadata panel: source automation, generation date, target keyword, estimated word count/read time

- Version or regeneration history if the post has been regenerated more than once (lightweight — a simple list is fine)

3.5 Integrations / Connect Your Blog

- A list of supported destinations to connect (WordPress, Webflow, Shopify, generic API/manual export)
- Connection status per integration (connected / not connected) and a simple connect flow (can be a modal — API key or OAuth-style, your choice)
- Guidance for what happens if no integration is connected yet (e.g. manual export/download option)

4. Deliverables

1. A Figma file (view + comment access) with all 5 screens, clearly labeled and organized into frames/sections.
2. A short design rationale (max 1 page) covering: your automation-setup flow decision (multi-step vs single form), how you designed the empty/zero-data states, and any assumptions you made about the product beyond what's specified here.
3. Mobile versions of the Marketing Landing Page and the Dashboard.
4. A connected prototype covering at least: Dashboard → Create Automation (template or custom) → Confirmation → back to Dashboard showing the new automation/posts.

5. Evaluation Criteria

- Clarity of information architecture for a data-dense dashboard (status, filters, bulk actions)
- Quality of the automation setup flow — is it simple enough for a non-technical user while still covering the necessary configuration?
- Handling of system states: empty, loading, failed/needs-attention, and success states
- Visual hierarchy and trust-building on the marketing landing page (this is a paid SaaS tool — it needs to look credible)
- Consistency of components across marketing site and product dashboard (shared design language, not two disconnected products)
- Original UI decisions — avoid directly copying rank.ai's layout; we want to see your own product thinking applied to this specific use case

6. Timeline & Submission

Duration: 3–4 days from receiving this brief.

Submission: Share the Figma file link and design rationale via email / the channel specified by the recruiter.

Add shanumishra7776@gmail.com as collaborator and then fill this form: https://forms.gle/5J8VduVtk9WfN8TaA
Questions during the task are welcome — reach out rather than guessing on ambiguous requirements.
